SUMMARY

AI engineer who ships. Self-taught builder on a Computer Science foundation, building agent backends on Google Cloud — containerized FastAPI on Cloud Run behind a load balancer, fronting Gemini, with Model Armor screening traffic in both directions. I own builds from requirements through production deploy. Every project below is live and publicly inspectable.

PROJECTS

A4RON.AI — Conversational Agent Backend | *Cloud Run · Docker · FastAPI · Load Balancer · Model Armor · Gemini 3.5 Flash* | aarondavidge.com/assistant.html

- Built and deployed a containerized FastAPI agent on Cloud Run, fronted by a Google Cloud Application Load Balancer at api.aarondavidge.com, serving the public concierge on my site.
- Routed all traffic through Model Armor, screening prompts and responses for injection and unsafe content before they reach Gemini 3.5 Flash or the user.
- Designed the agent in Agent Studio and packaged it in Docker for reproducible deploys; it carries a visible "AI · can be wrong" disclosure and a human-escalation path.
- Deliberately scoped it to conversational Q&A it can answer reliably rather than shipping ungrounded retrieval; RAG and tool calling are the next milestones.

Zero-Day Intelligence Pipeline | *Python · Web scraping · Scheduled ingestion* | [View repository](#)

- Automated pipeline that ingests Google Project Zero's root-cause analyses of in-the-wild zero-days and republishes them as structured, queryable records.
- Parses inconsistent source formatting and re-runs on a schedule to pick up new disclosures without duplicating entries.

aarondavidge.com — Multi-Subdomain Web Platform | *HTML · Tailwind · JavaScript · GitHub Pages* | aarondavidge.com

- Designed and shipped the hub tying together the home, blog, store, and assistant surfaces, with full SEO and Open Graph metadata.
- Hand-built without a framework: static blog and a static storefront with demo product cards. Stripe integration and a Flutter management dashboard are the next phases.

TECHNICAL SKILLS

- **Languages:** Python, JavaScript, Java, C++, Bash, Assembly, HTML/CSS
- **AI & Agents:** Gemini 3.5 Flash, Model Armor, Agent Studio, Gemini Enterprise Agent Platform, Google AI Studio, Google ADK, Model Garden, prompt and context engineering
- **Backend:** FastAPI, REST API design, Docker, containerized deployment
- **Cloud & Infrastructure:** Google Cloud — Cloud Run, Application Load Balancing; Antigravity, Git, GitHub Actions, GitHub Pages
- **Frontend:** Tailwind CSS, vanilla JavaScript, semantic HTML, responsive layout, SEO and Open Graph
- **Currently developing:** RAG and vector search, tool calling, multi-agent orchestration, agent evaluation, Flutter, Stripe, PostgreSQL

EDUCATION

Computer Science, B.S. program — ~100 credit hours completed across two accredited institutions

- Southeastern Louisiana University (~90 hours, 4 years) · Louisiana State University (~8 hours, 1 year) — open to completing the remaining requirements.
- **Computer science:** Data Structures (C++), Algorithms I & II (Java), Software Engineering (React, Redux, Express, MongoDB), Assembly, Systems Administration (Bash), Data Science (Python, Kaggle).
- **Mathematics:** Calculus I–III, calculus-based statistics covering continuous and discrete distributions, differential equations.

ADDITIONAL

- **Client & delivery:** Translate business requirements into shipped solutions with stakeholders directly; coach non-engineers on using agents and LLMs.
- **Writing:** Technical blog on agentic development and AI engineering — aarondavidge.com/blog
- **Security practice:** Secure-by-default design and secrets hygiene; published disclosure policy — aarondavidge.com/disclosure
